1 SAFETY INFORMATION

Important – Read Before Installation

Users should have a detailed understanding of GDS-49 operating and maintenance instructions. Use the GDS-49 only as specified in this manual or detection of gases and the resulting protection provided may be impaired. Read the following **WARNINGS** prior to use.

WARNINGS

- The GDS-49 sensor transmitter described in this manual must be installed, operated and maintained in accordance with information contained herein. Installation in any hazardous area must comply with all applicable restrictions, requirements and guidelines for said hazardous areas. It is the end user customer's final decision to ensure that the GDS-49 is suitable for the intended use.
- The GDS-49 is designed and constructed to measure the level of certain gases in ambient air. Accuracy in atmospheres containing steam or inert gases cannot be guaranteed.
- Always mount the sensor head vertically with the sensor head facing down.
- Do not paint sensor assembly.
- Do not operate the GDS-49 if its enclosure is damaged or cracked or has missing components. Make sure the cover, internal PCB's and field wiring are securely in place before applying power.
- Do not expose the GDS-49 to electrical shock or continuous severe mechanical shock. Protect the GDS-49 and related sensor assemblies from dripping liquids and high power sprays.
- Calibrate with known target gas at start-up and check on a regular schedule, at least every 90 days. More frequent inspections are encouraged to spot problems such as dirt, oil, paint, grease or other foreign materials on the sensor head.
- Periodically test for correct operation of the system's alarm events by exposing the monitor to a targeted gas concentration above the High Alarm set point.
- Use only for applications described within this manual.

2 GENERAL INFORMATION

The GDS-49 Remote Sensor Transmitter is designed to convert the low level 'micro amp' output signals from electrochemical toxic gas sensors into an uncalibrated 4-20mA current sink ("loop powered") output suitable for transmission over long distances. The GDS-49 is ideally suited for installation where reliability and cost are critically important and where a local display is not required.

Features

- Standard 4 to 20 mA output (current sink)
- Certified for use in Class I Division 1, Groups B, C & D hazardous areas for non-reactive gases (10-0248)
- Certified for use in Class I Division 1, Groups B, C & D hazardous areas for all gases when installed as Intrinsically Safe with appropriate IS barrier (10-0248IS)
- Easily-replaceable sensor element
- Fault indication for sensor fail or missing sensor
- Non-polarized two-wire output eliminates wiring errors
- Constructed of 316 stainless steel
- Reliable electrochemical toxic sensor technology

Electrochemical Sensors operate on the principle that the presence of a target gas causes a chemical reaction that produces free electrons in an electrolyte solution. These electrons flow through an external circuit to provide an indication of the amount of gas present. In addition, there is a separate circuit that feeds electrons back into the sensor to maintain the electrolyte in an electrically balanced state. The GDS-49 incorporates this circuitry along with a 4-20mA output stage inside the sensor head.

Electrochemical sensors contain a fixed amount of active electrolyte depending on the range and expected lifetime exposure to the target gas. As the sensor ages, the electrolyte is used up and the amount of output per ppm of target gas decreases. At some point, the output value drops below an acceptable threshold and the sensor must be replaced.

In general, electrochemical sensors are extremely reliable and offer excellent price / performance. However, users should be aware that extremes in temperature or relative humidity can cause an electrochemical sensor to lose sensitivity, and exposure to certain chemicals or gases can temporarily or, in some cases, permanently reduce the output or drive the sensor into a fault condition. For more information on specific sensor types, contact GDS Corp.

3 SPECIFICATIONS

Model: GDS Corp Remote Sensor Transmitter for Toxic Gases

Power Input: 4-20mA current loop; power consumption less than 0.25 watts max in over-range condition; typically less than 0.1watt

Display: None

Input: Direct connect toxic sensors for Oxygen, Carbon Monoxide, Chlorine, Chlorine Dioxide, Hydrogen, Hydrogen Sulfide, Hydrogen Cyanide, Hydrogen Chloride, Hydrogen Fluoride, Sulfur Dioxide, Ammonia, Ozone, Ethylene Oxide, Arsine, Silane, Fluorine, Phosgene, Hydrazine, Nitric Oxide, Nitrogen Dioxide, Mercaptan, THT, Diborane.

NOTE: This list is not all-inclusive as many electrochemical sensors will respond to more than one gas. Contact GDS Corp for more details.

Note: Certain 'sticky' gases require the removal of the flame arrestor for proper operation. For these situations, the GDS-49 is certified as Intrinsically Safe when installed with an appropriate IS barrier.

Accuracy: +/- 5% of full scale (typical)

Calibration: Output is factory adjusted but is not calibrated. Receiving device must provide zero and span (two-point) calibration. The GDS-49 is compatible with all GDS Corp controllers and third-party devices with 4-20mA inputs that provide two-point calibration capability.

Output: 4-20 mA (current sink), max.750 ohm load at 24 VDC supply voltage

Response Determined by sensor type and range

Time:

Temperature: Electronics -25° to +60°C; sensor limits may vary

Fault Output drops to < 3mA to indicate sensor fault or missing sensor

Indication:

Housing: Junction box epoxy-coated aluminum, sensor head 316 stainless steel.

Approvals: CSA Class 1, Division 1, Groups B, C and D Explosion Proof with flame arrestor; Intrinsically Safe for all sensors if used with IS barrier.

Warranty: Two years on electronics, one year on sensor

4 INSTALLATION

CHOOSING A LOCATION

Factors such as air movement, gas density, emission sources and environmental variables affect sensor location. Air movement by fans, prevailing winds and convection should be carefully evaluated to determine if a leak is more likely to raise gas levels in certain areas within the facility. Vapor density of a gas determines if it will rise or fall in air when there are no significant currents. Lighter than air gases should have the monitors mounted 12 – 18 inches (30 – 45 cm) above the potential gas leak and heavier than air gases should be this distance below. Even though the GDS-49 sensor transmitter is designed for rugged service, it should be protected from environmental damage from water, snow, shock, vibration and dirt.

The GDS-49 should always be mounted with the sensor head opening facing down. If necessary, a Splash Guard (p/n 10-0205) should be attached if there is any chance that water or liquid spray could enter the sensor opening from below. Be sure to leave sufficient room (~ 12") below the sensor head to allow easy access for attachment of a Calibration Cup and / or removal of the sensor head cover for sensor replacement.

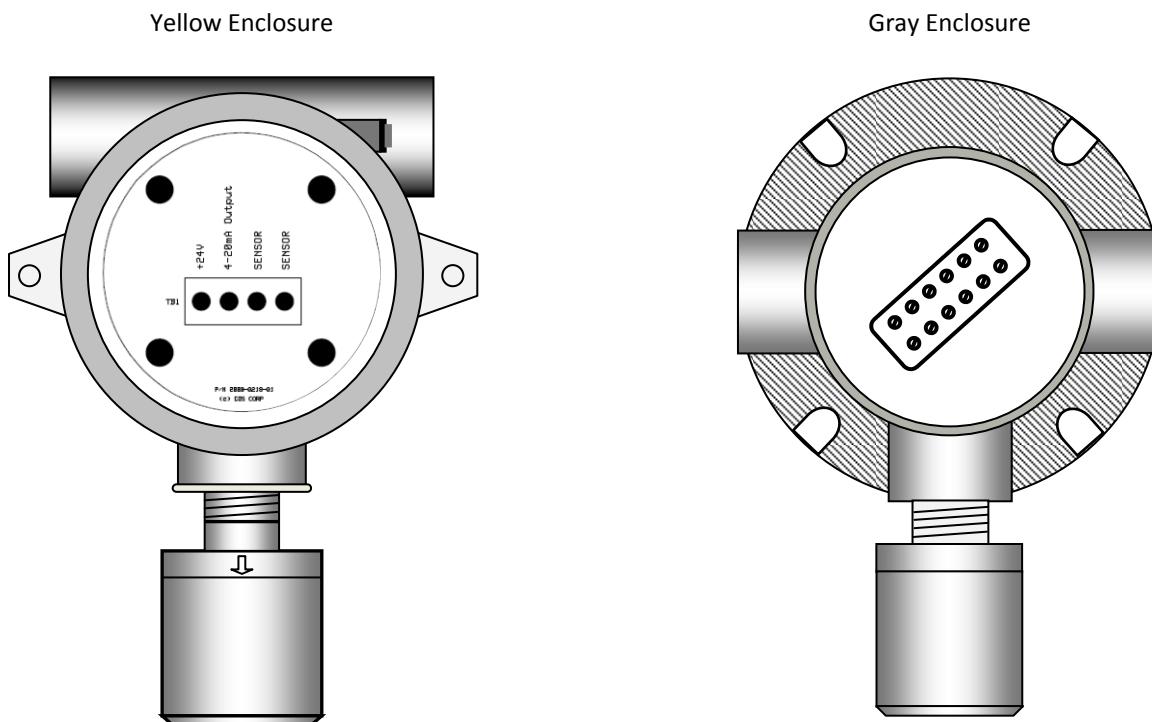

Figure 4-1: GDS-49 Remote Sensor Transmitter

ELECTRICAL CONNECTIONS

The GDS-49 is a two-wire, loop-powered sensor transmitter that derives its power from the current flowing in the loop. The electronics require approximately 9VDC to operate properly. That means that if the loop excitation voltage is 24VDC, then approximately 15VDC can be dissipated in the wiring and loop load resistors. The output is non-polarized, so either terminal of the GDS-49 can be connected to the positive side of the loop.

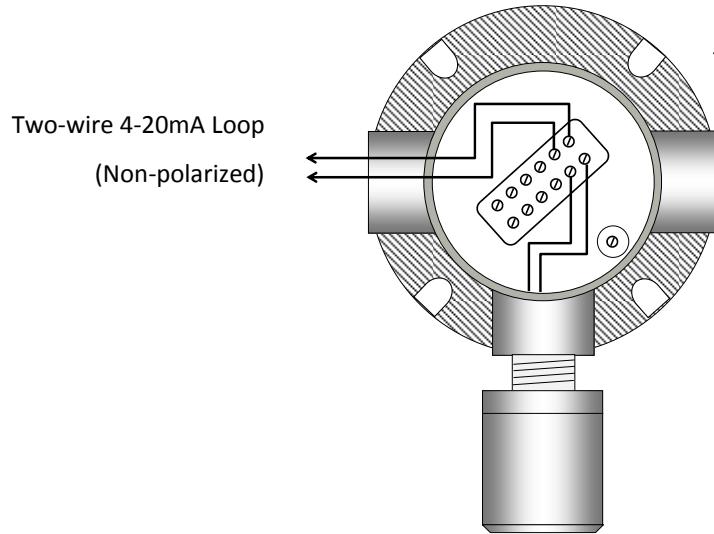

Figure 4-2: GDS-49 Wiring Connections (Gray Enclosure)

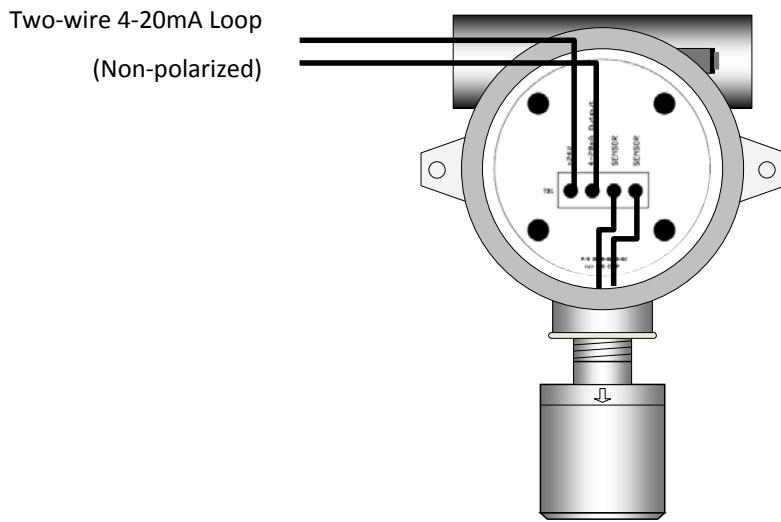

Figure 4-3: GDS-49 Wiring Connections (Yellow Enclosure)

Shielded cable is always recommended. Wiring should be installed in metal conduit with no other cabling in the same conduit. When power is initially applied to the GDS-49 the 4-20mA output may momentarily indicate a temporary off-scale low (FAULT) or off-scale high (VERRANGE) value before settling down. All GDS Corp controllers provide a ‘warm up’ interval during which the sensor input is ignored. This keeps the controller from indicating an alarm due to sensor warm-up characteristics.

Total warm-up time is dependent on the type of sensor and range selected. GDS Corp recommends a four to eight hour interval between initial power-on and first calibration. If the sensor has been powered up, and has only been offline for a few hours, the warm-up time will be shorter.

5 CALIBRATION

CALIBRATION OVERVIEW

The GDS-49 does not have the capability to perform zero and span calibration. Each sensor includes a fixed gain resistor that establishes the approximate baseline output for any given gas concentration, and final zero and span calibration must be performed by 4-20mA signal receiving device.

Follow these GDS-49 calibration guidelines:

- Calibration accuracy is only as good as the calibration gas accuracy. GDS Corp calibration gases are traceable to NIST (National Institute of Standards and Technology).
- **Never use calibration gas that has passed its expiration date.**
- Always use a GDS Corp calibration cup that completely surrounds the sensor head.
- Be sure to use ZERO AIR, a mixture of 21% oxygen and 79% nitrogen, as a zero reference unless you are certain that no target gas exists in the area. Ambient gas may result in an 'elevated zero' condition that will cause a FAULT to occur once the ambient gas is no longer present.
- GDS Corp recommends using a span gas that is between 25% and 75% of full scale. GDS Corp does not recommend using full scale as the span set point.
- **Always calibrate a new sensor before depending on the device for personnel or equipment safety**
- Calibrate on a regular schedule. GDS Corp recommends a full calibration every 3 months, with periodic 'bump tests' on a more frequent basis to ensure that the sensor has not been affected by temperature extremes or the presence of incompatible gases.

In general, calibration involves applying a zero reference gas and telling the receiving device to accept that output as 'zero', followed by the application of a span reference gas and then telling the receiving device to accept the new output as 'span' once the output has stabilized. This is generally performed by two persons, one at the sensor transmitter and one at the receiving device. Actual procedures, time intervals and techniques for indicating zero and span values depend on the specific receiving device. All GDS Corp display and alarm controllers provide the necessary local calibration capability.

GENERALIZED CALIBRATION PROCEDURE

Before beginning calibration, make sure you have the following items: A cylinder of calibration gas, fixed flow regulator and an appropriate calibration cup connected to the regulator via a length of flexible tubing. If necessary, a cylinder of 'zero air' may be necessary if the absence of target gas cannot be confirmed. For chlorine, chlorine dioxide and hydrogen cyanide, GDS Corp recommends a flow rate of 1.0 liter / minute. For all other gases, a flow rate of 0.5 liters / minute is appropriate.

The actual steps involved in calibration vary depending on the receiving device, but can be generalized as follows:

1. Select the appropriate channel on the controller or receiver and enable Calibration Mode. This should disable alarms during the calibration process. Make sure that the controller's Cal Span value matches the cylinder of calibration gas.
2. Apply zero air to the sensor as shown in Fig. 6-1 or confirm the absence of any target gas.
3. At the controller or receiver, press the "Set Zero" button to confirm that the current reading is 'zero'.
4. Apply span gas to the sensor as shown in Fig 6-1.
5. At the controller or receiver, monitor the output until it stabilizes. When stable, press the "Set Span" button to confirm that the current reading corresponds to the Span value.
6. Turn off the regulator and remote the calibration cup from the sensor head.
7. At the controller or receiver, exit Cal Mode and resume normal operation.

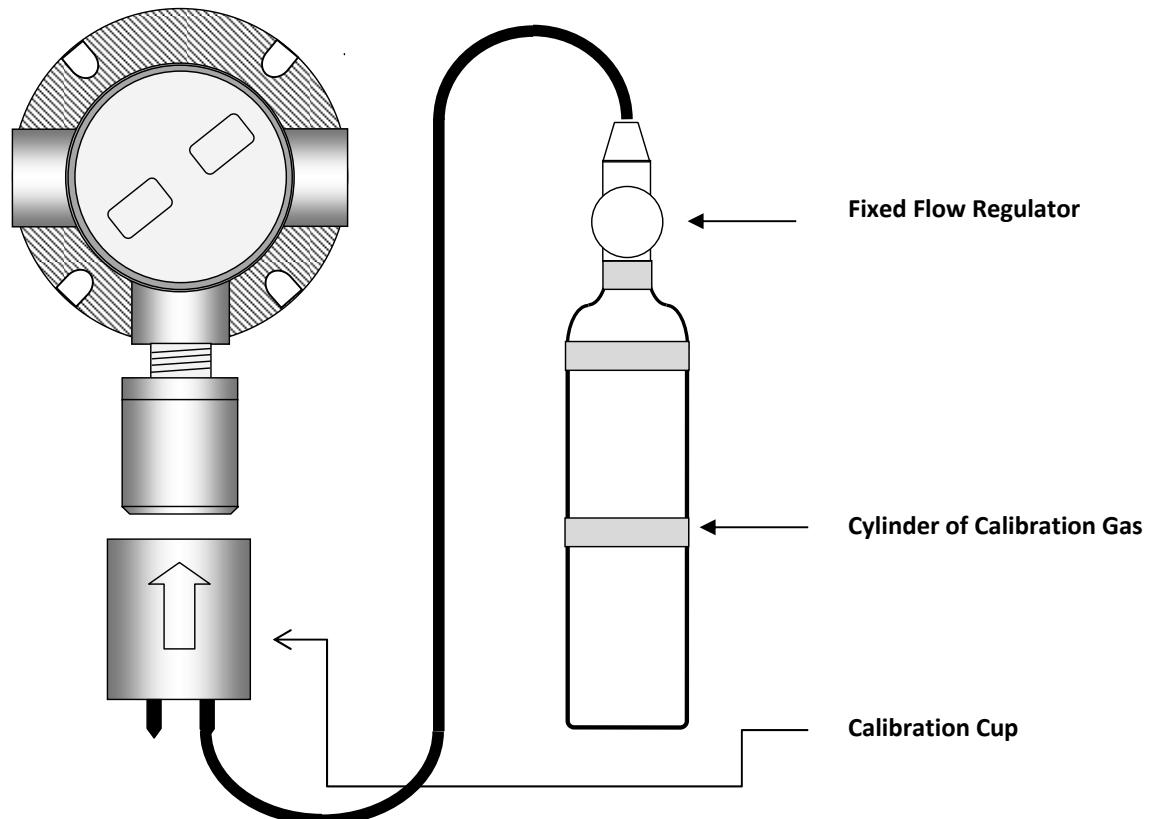

Figure 5-1: Applying Calibration Gas to GDS-49

6 OPERATION AND MAINTENANCE

In the normal operating mode, the 4-20 mA signal level corresponds to the detected gas concentration. In the event of a significant gas release, the GDS-49 will indicate an overrange condition up to approximately 30mA if the sensor's output continues to increase beyond the full scale value. In the event that the sensor output drops below zero due to interference gases or sensor failure, the 4-20mA output will drop to approximately 2.2mA, indicating a FAULT condition to the remote receiver or controller. If the sensor is removed, the output will also drop to 2.2mA.

The GDS-49 should be checked regularly for damage, water ingress or flame arrestor clogging due to excessive dust or dirt. If the flame arrestor has become contaminated by dust, dirt or moisture, remove the sensor head cover (after first making sure to declassify the area) and carefully clean with compressed air. Use of solvent is discouraged as remnants of the solvent material may affect the sensor. There are no user-serviceable components and maintenance is limited to cleaning and/or sensor replacement.

Some GDS Corp controllers and gas detectors monitor 'sensor life' by calculating a value between 0 and 100% based on the current response to calibration gas as compared to the initial response when the sensor was first installed. To ensure that the calculations are accurate, please make certain to follow the 'new sensor' installation instructions in the appropriate device manual.

SENSOR REPLACEMENT

If a sensor shows FAULT, does not respond to gas or can no longer be calibrated, it should be replaced. GDS-49 sensor transmitters use GDS Corp type 10-90XX sensors, where the XX is the gas type shown in Section 3. The range value should also be specified when ordering replacement sensors. For example, a replacement H2S sensor for 0-100 ppm would be "10-9015-R0100".

To replace a sensor, review Fig. 6-1 and follow these steps:

1. Declassify the area or remove power to the GDS-49.
2. Unscrew the sensor head cover. If unable to open the cover by hand, use a Sensor Head Replacement Tool (p/n 10-0187).
3. Remove the old sensor by pulling straight down.

NOTE: PULL STRAIGHT DOWN. DO NOT TRY TO UNSCREW THE SENSOR.

4. Carefully install the replacement sensor by aligning the arrow on the sensor with the arrow engraved on the sensor head. Push straight up until the sensor connector seats firmly into the sensor connector.
5. Reinstall the sensor head cover by CAREFULLY screwing the cover onto the sensor head.

NOTE: IF THE SENSOR FALLS OUT OF THE SENSOR HEAD DURING THIS STEP, IT CAN BE DAMAGED. USE

CAUTION WHEN REINSTALLING THE SENSOR HEAD COVER.

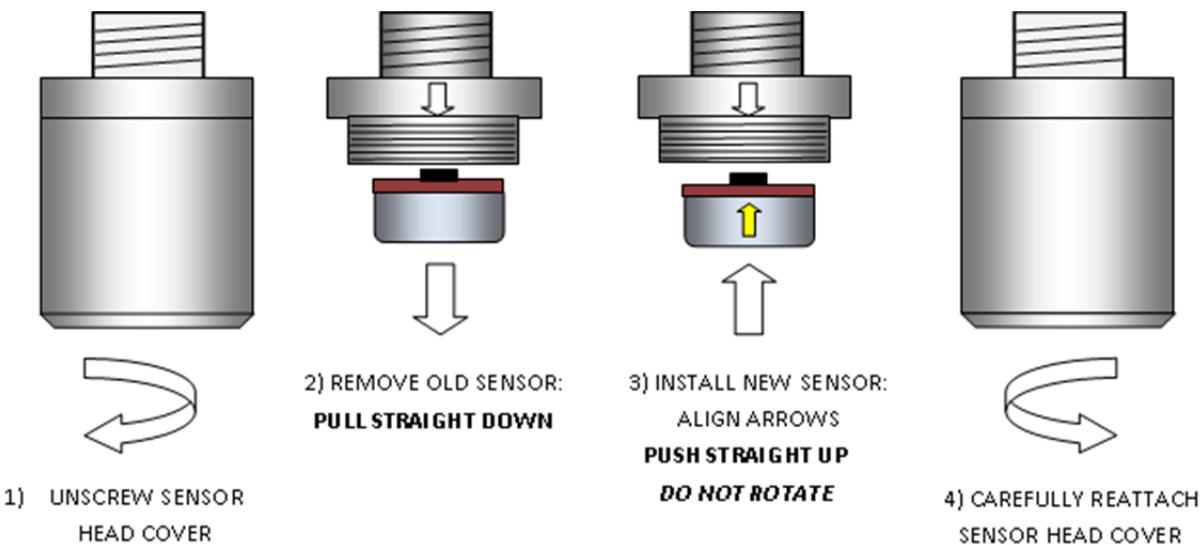

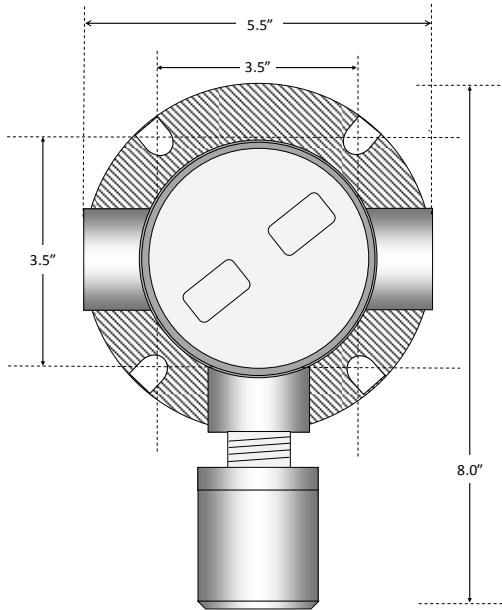

Figure 6-1: Sensor Replacement

7 SPARE PARTS

GRAY ENCLOSURE

Enclosure + Sensor Head (No sensor):

- 20-0129 Full assembly less sensor (gray)
20-0130 Full assembly less sensor (gray) for reactive gas

Enclosure / Junction Box Only:

- 20-0098 Gray junction box enclosure w/ PCB

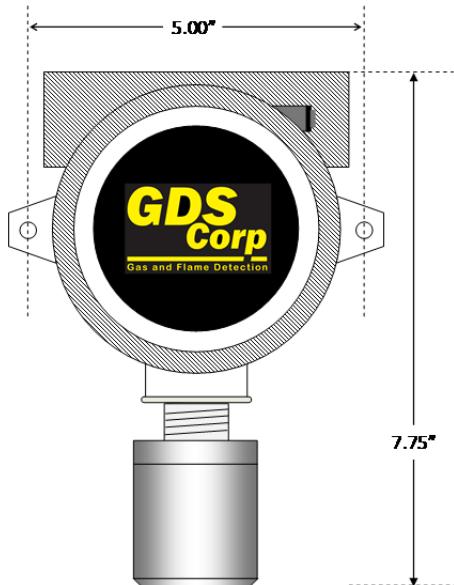

Sensor Head Only:

- 10-0248 Toxic Sensor-Transmitter (Type 1-2)
10-0248F Toxic S-T for Reactive Gas (Type 3-4)
Note: Does not include sensor

Sensor:

- 10-90xx GDS Corp toxic sensor
